

Antibiotic Susceptibility of Common Organisms

2021 STHS Heart - All Units

Numbers indicate percent susceptible; only the first isolate per patient per period is included

Resistance: 40% MRSA, 4% VRE, 24% ESBL

¹ Ampicillin susceptibility for Enterococcus indicates susceptibility to amoxicillin, amoxicillin-clavulanate, ampicillin-sulbactam, and piperacillin-tazobactam

² Aztreonam use is reserved for severe penicillin allergy (e.g. anaphylaxis); caution: may cross-react with ceftazidime allergy

³ Tetracycline susceptibility indicates susceptibility to doxycycline and minocycline; some organisms resistant to tetracycline may be susceptible to doxycycline or minocycline

⁴ When used for therapy of uncomplicated UTIs due to E. coli, K. pneumoniae, and P. mirabilis, cefazolin susceptibility indicates susceptibility to the oral agents cefaclor, cefdinir, cefpodoxime, cefprozil, cefuroxime axetil, and cephalexin

⁵ Nitrofurantoin is indicated for use in cystitis only; it should not be used for systemic infections, including pyelonephritis

⁶ Use of 3rd generation cephalosporins is not recommended, these organisms frequently become resistant during therapy

⁷ Oxacillin and cefazolin are considered first-line antibiotic therapy for MSSA

⁸ For staphylococci and enterococci that test susceptible, aminoglycosides must be used in combination with beta-lactams or vancomycin for synergy

^y Susceptibility rates determined on small sample size (<30) and may be statistically unreliable; interpret with caution
